|-------------------------------------------------------------------|------------------|
| <i>Preface</i>                                                    | <i>page</i> xiii |
| <b>1 Basic concepts</b>                                           | <b>1</b>         |
| 1.1 History of the term “plasma”                                  | 1                |
| 1.2 Brief history of plasma physics                               | 1                |
| 1.3 Plasma parameters                                             | 3                |
| 1.4 Examples of plasmas                                           | 4                |
| 1.5 Logical framework of plasma physics                           | 4                |
| 1.6 Debye shielding                                               | 7                |
| 1.7 Quasi-neutrality                                              | 11               |
| 1.8 Small- vs. large-angle collisions in plasmas                  | 12               |
| 1.9 Electron and ion collision frequencies                        | 16               |
| 1.10 Collisions with neutrals                                     | 19               |
| 1.11 Simple transport phenomena                                   | 20               |
| 1.12 A quantitative perspective                                   | 23               |
| 1.13 Assignments                                                  | 25               |
| <b>2 The Vlasov, two-fluid, and MHD models of plasma dynamics</b> | <b>34</b>        |
| 2.1 Overview                                                      | 34               |
| 2.2 Phase-space                                                   | 34               |
| 2.3 Distribution function and Vlasov equation                     | 35               |
| 2.4 Moments of the distribution function                          | 38               |
| 2.5 Two-fluid equations                                           | 41               |
| 2.6 Magnetohydrodynamic equations                                 | 52               |
| 2.7 Summary of MHD equations                                      | 61               |
| 2.8 Classical transport                                           | 62               |
| 2.9 Sheath physics and Langmuir probe theory                      | 64               |
| 2.10 Assignments                                                  | 69               |

|          |                                                                         |            |
|----------|-------------------------------------------------------------------------|------------|
| <b>3</b> | <b>Motion of a single plasma particle</b>                               | <b>75</b>  |
| 3.1      | Motivation                                                              | 75         |
| 3.2      | Hamilton–Lagrange formalism vs. Lorentz equation                        | 76         |
| 3.3      | Adiabatic invariant of a pendulum                                       | 80         |
| 3.4      | Extension of WKB method to general adiabatic invariant                  | 83         |
| 3.5      | Drift equations                                                         | 88         |
| 3.6      | Relation of drift equations to the double adiabatic<br>MHD equations    | 108        |
| 3.7      | Non-adiabatic motion in symmetric geometry                              | 115        |
| 3.8      | Particle motion in small-amplitude oscillatory fields                   | 129        |
| 3.9      | Wave–particle energy transfer                                           | 131        |
| 3.10     | Assignments                                                             | 142        |
| <b>4</b> | <b>Elementary plasma waves</b>                                          | <b>146</b> |
| 4.1      | General method for analyzing small-amplitude waves                      | 146        |
| 4.2      | Two-fluid theory of unmagnetized plasma waves                           | 147        |
| 4.3      | Low-frequency magnetized plasma: Alfvén waves                           | 155        |
| 4.4      | Two-fluid model of Alfvén modes                                         | 164        |
| 4.5      | Assignments                                                             | 172        |
| <b>5</b> | <b>Streaming instabilities and the Landau problem</b>                   | <b>174</b> |
| 5.1      | Overview                                                                | 174        |
| 5.2      | Streaming instabilities                                                 | 174        |
| 5.3      | The Landau problem                                                      | 180        |
| 5.4      | The Penrose criterion                                                   | 200        |
| 5.5      | Assignments                                                             | 203        |
| <b>6</b> | <b>Cold plasma waves in a magnetized plasma</b>                         | <b>206</b> |
| 6.1      | Overview                                                                | 206        |
| 6.2      | Redundancy of Poisson’s equation in electromagnetic<br>mode analysis    | 206        |
| 6.3      | Dielectric tensor                                                       | 208        |
| 6.4      | Dispersion relation expressed as a relation between $n_x^2$ and $n_z^2$ | 223        |
| 6.5      | A journey through parameter space                                       | 225        |
| 6.6      | High-frequency waves: Altar–Appleton–Hartree<br>dispersion relation     | 228        |
| 6.7      | Group velocity                                                          | 233        |
| 6.8      | Quasi-electrostatic cold plasma waves                                   | 234        |
| 6.9      | Resonance cones                                                         | 236        |
| 6.10     | Assignments                                                             | 240        |

|           |                                                                         |            |
